E-mail: martinss@imada.sdu.dk

- weak and strong scaling (not easy on current architectures!)
- non optimized codes waste energy and money!

[Martins et al 2024]

AI factories

- increased focus on AI hardware
- right now, it's good for lattice
- not sure about future hardware
- keep flexible boundaries

First Global Gyrokinetic Simulations of Multi-Scale Plasma Turbulence in Tokamaks

1,520,000

Awarded Resources (in node hours)

LUMI-G

System Partition

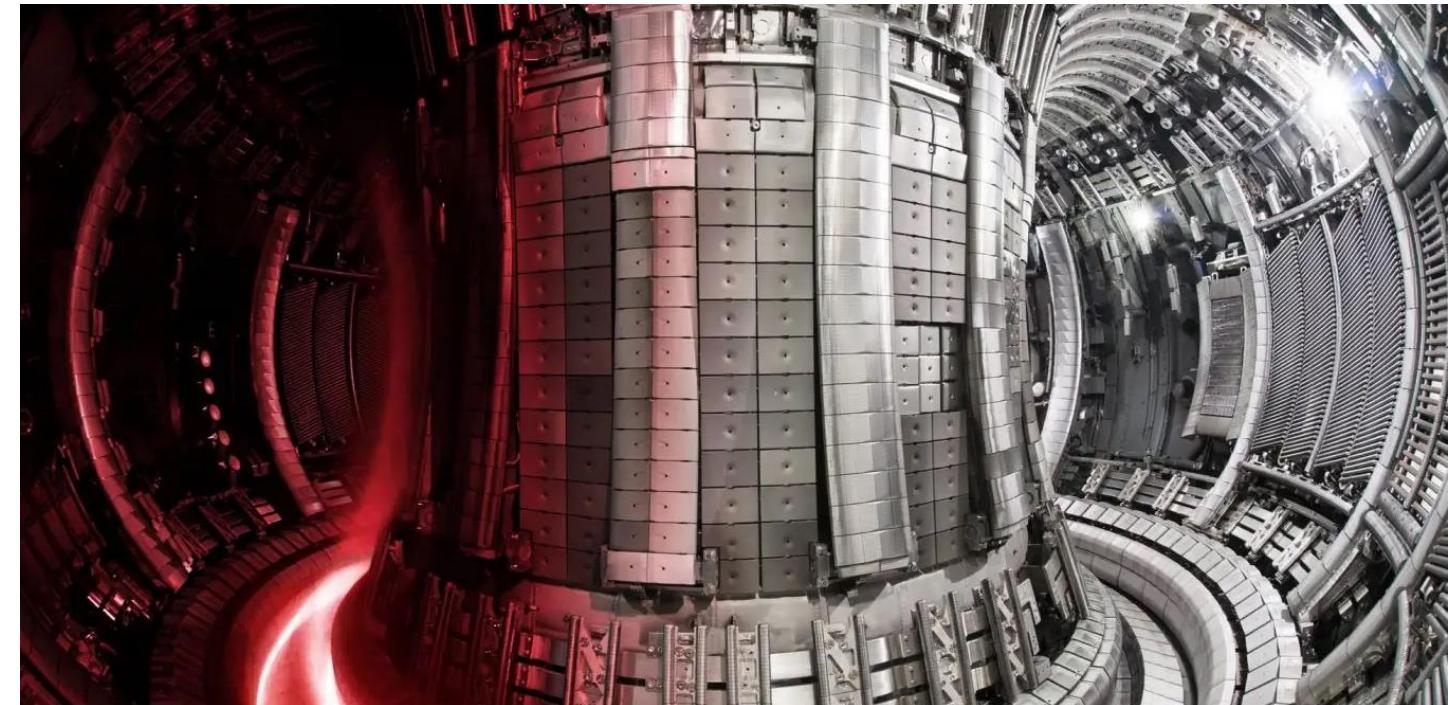

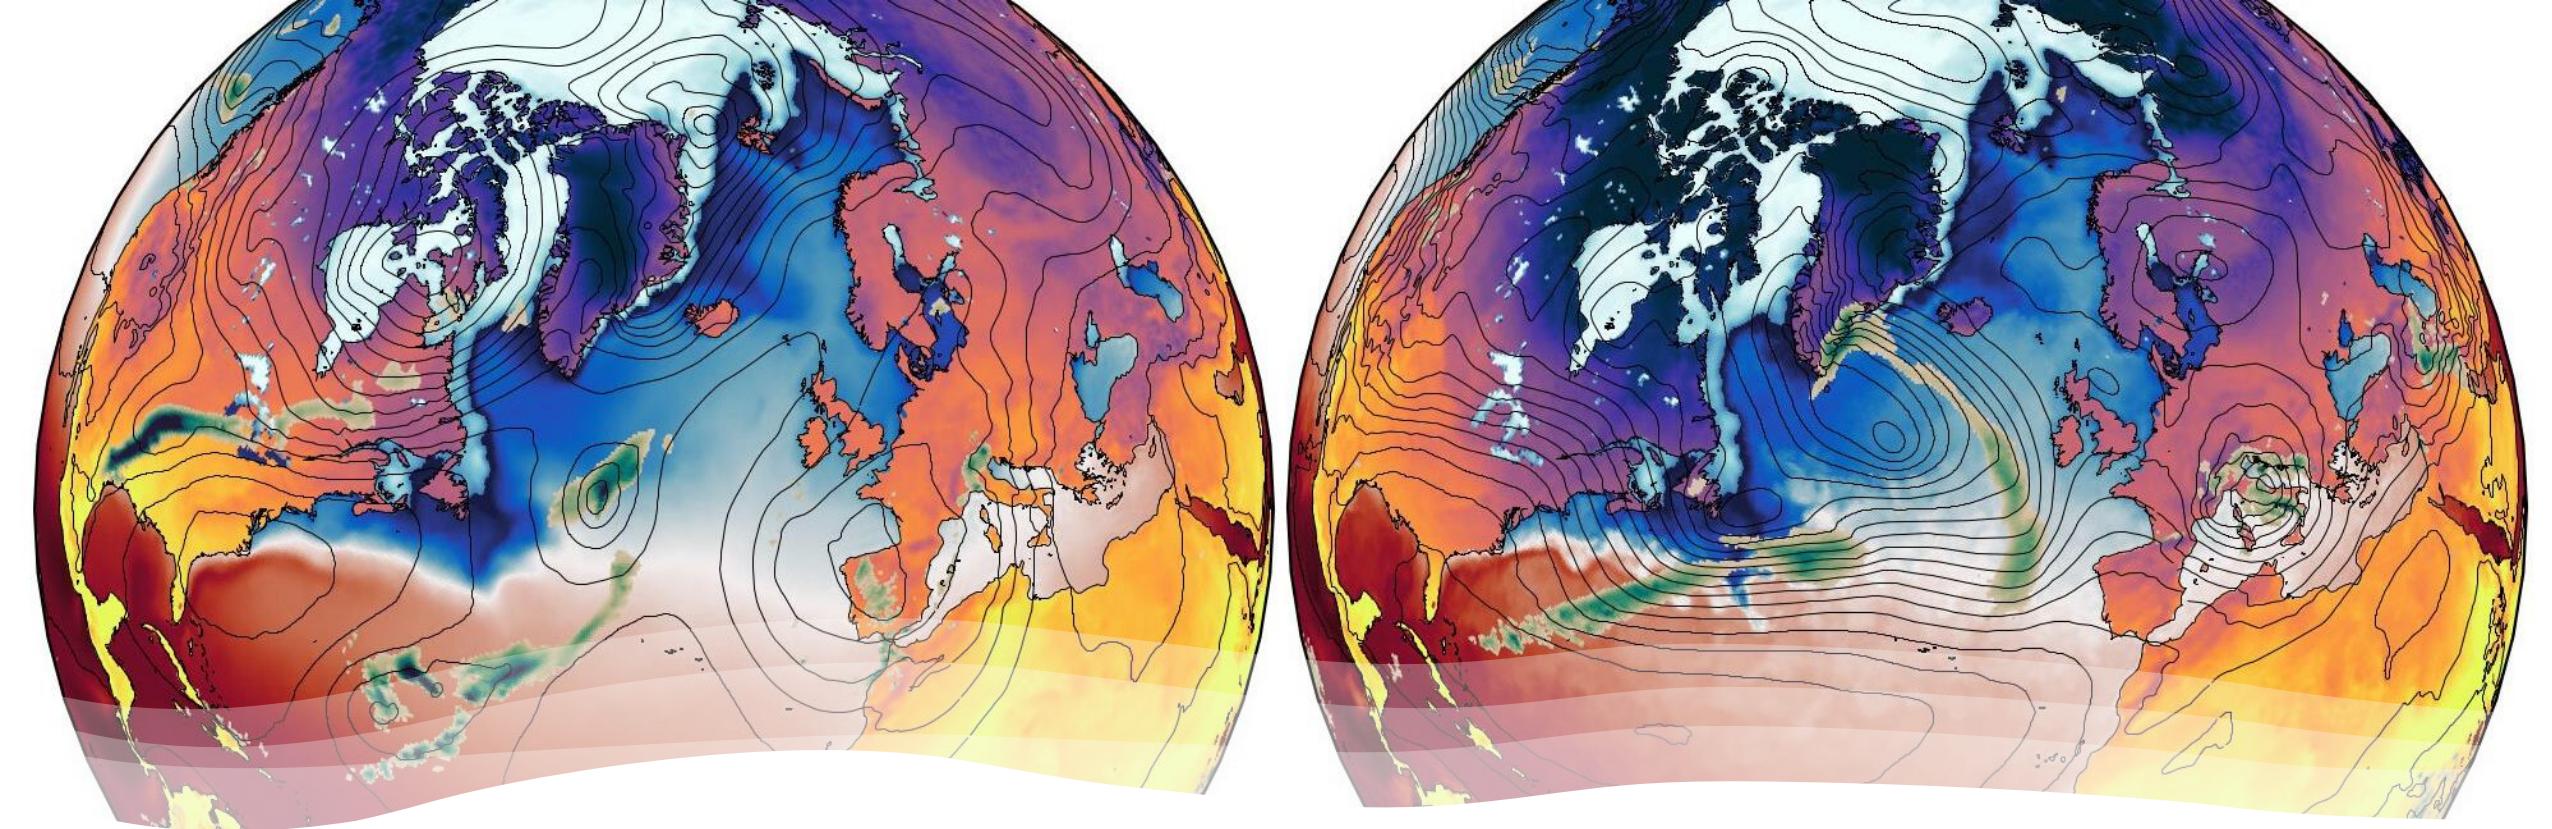

1 May 2024 - 30 April 2025

Allocation Period

Nuclear Fusion

- GENE codebase
- international collaboration
- GPU-enabled
- Potentially huge societal impact

Weather simulations

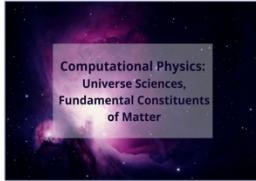

More EuroHPC projects

Just a few examples...

Cloud-Circulation Coupling in a Changing Climate (C5)

For the first time in the history of climate modelling, it is becoming possible to run multi-year climate simulations with a global atmospheric model that has a horizontal resolution of a few kilometers.

Forward-Modeling the First Billion Years

The birth of the first stars, galaxies and black holes heralded the beginning of the Cosmic Dawn (CD).

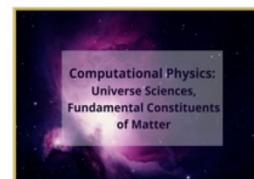

FemtoDose

FLASH radiotherapy (RT) consists in delivering a therapeutic dose over much shorter times than in conventional treatment protocols.

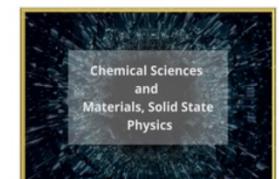

Large Scale and High Resolution CFD Simulations for Wave Energy Farms

The project aims to perform the first simulation of a wave energy farm using high-fidelity numerical modelling to anticipate the effects of arraying wave energy converters (WECs) within the same sea stretch.

The continuum limit of lattice QCD for high-precision tests of the standard model of particle physics from domain wall fermions

Exploring the standard model of particle physics and finding new physics beyond is in many cases limited by the lack of high-precision knowledge of low-energy QCD effects.

Universal Machine Learning Potential for Complex Metal Alloys

Atomistic modeling can provide mechanistic insights and improved design principles, but it is limited by the complexity of modern alloys that involve up to a dozen carefully tuned components.

Short Summary

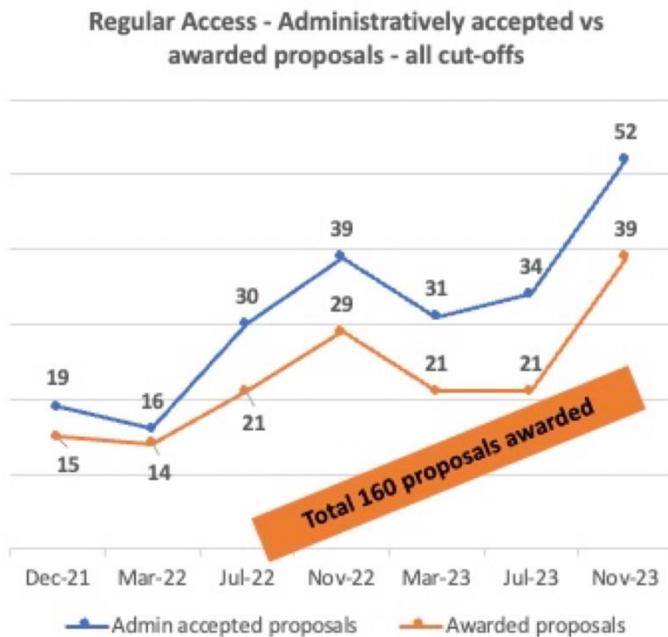

- Heterogeneous ecosystem
 - Porting & efficiency are tricky
 - ... or rather they require a lot of work (and collaboration)!
- Need adequate human resources
 - Highly-specialised workforce
 - Training/careers/retention

Who is using these machines? How do we access them?

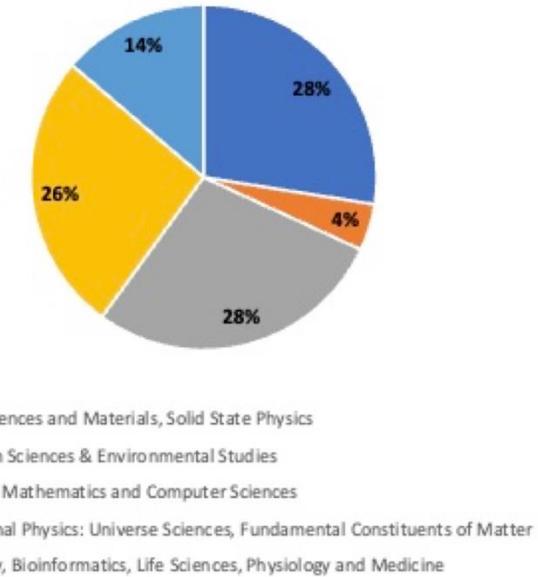

resource allocation

- A single panel across *all* domains – one-year **focused** applications
- Raises the bar for ***all*** domains
- Quality of applications has improved – frequency of calls
- Very expensive in terms of human resources (thank you !)

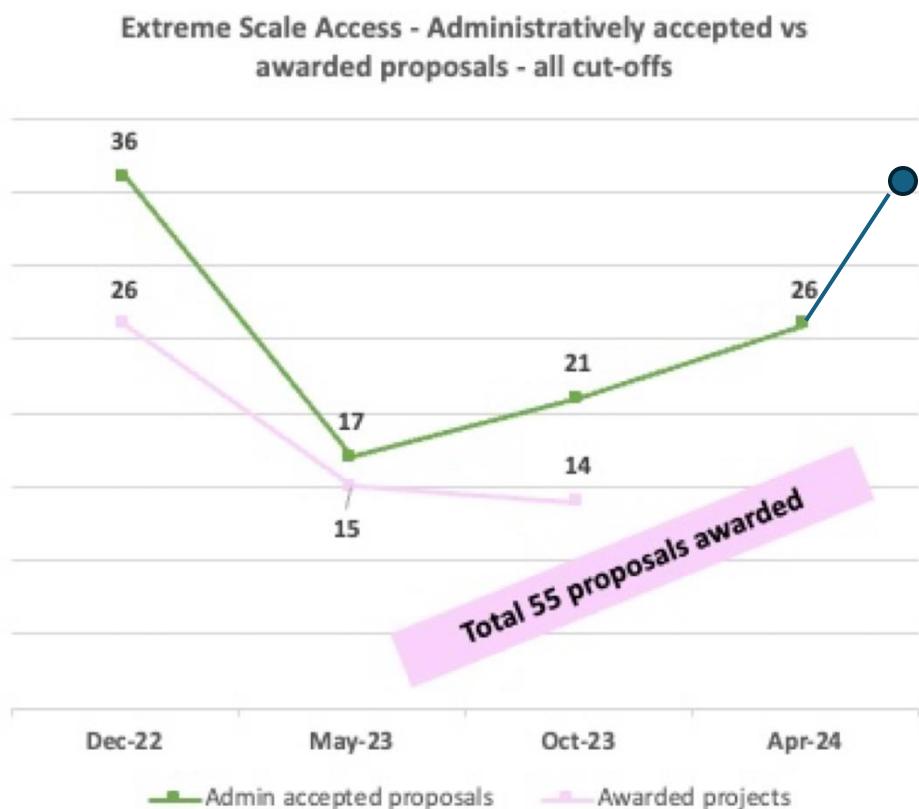

Regular Access statistics – proposal numbers

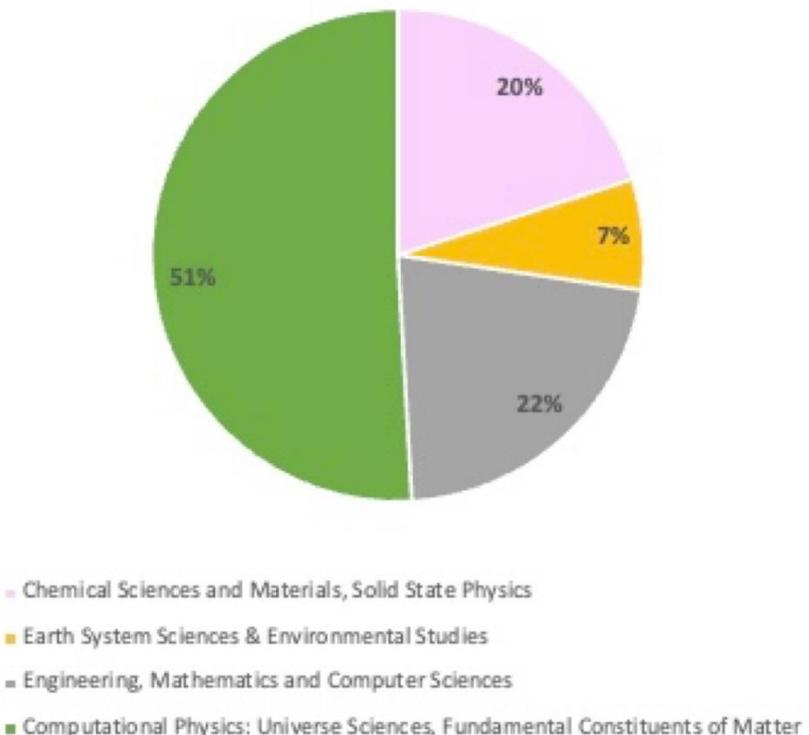

Regular Access call (Dec 2021-Nov 2023) - Research domains distribution

Extreme Scale Access statistics – proposal numbers

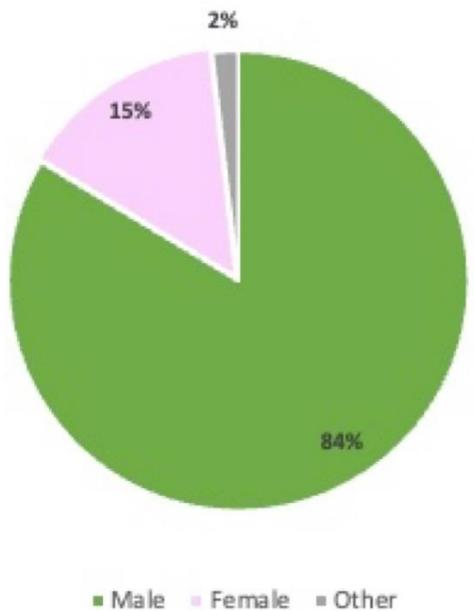

Extreme Scale Access (Dec 2022-Oct 2023) - research domains distribution – awarded projects

fantastic resource for European research & leadership

Extreme Scale Access statistics – gender distribution

Extreme Scale Access (Dec 2022-Oct 2023) - awarded projects - PI gender distribution

PI GENDER DISTRIBUTION – AWARDED PROJECTS		
GENDER	Number of proposals	%
Male	46	84%
Female	8	15%
Unspecified	1	2%
TOTAL	55	100%

PI GENDER DISTRIBUTION – SUBMITTED PROPOSALS		
GENDER	Number of proposals	%
Male	64	80%
Female	15	19%
Unspecified	1	1%
TOTAL	80	100%

anecdotes: peer review is hard! (but the best)

- a good proposal needs to have
 - ... solid motivations
 - ... ambitious goals
 - ... performant software
 - ... requests that are justified by milestones
- all of this needs to be **in the application!**
 - ... needs to be **clearly stated** for external reviewers
 - ... and for a majority of panel members

more anecdotes

- economics is the management of insufficient resources
 - what could you do with half of the requested time?
- I would love to allocate **all** proposed projects

more anecdotes

- economics is the management of insufficient resources
 - what could you do with half of the requested time?
- I would love to allocate **all** proposed projects
- ... actually, **NO**, I would only allocate the good ones!
- there are **two** calls per year, this allows rejected projects to improve and resubmit quickly
- this is a great resource, projects do improve

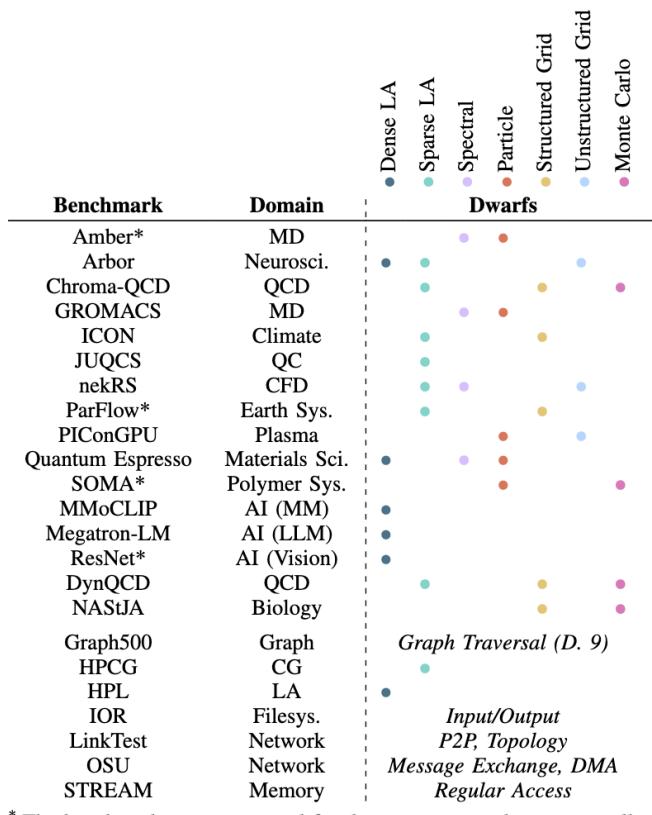

a financial curiosity

- try buying computer time?
- cloud providers charge for 250k node-hr...

a financial curiosity

- try buying computer time?
- cloud providers charge for 250k node-hr... M€
- EuroHPC is a fantastic research infrastructure
- it is our duty to make the best use of it
- help the ARC: keep submitting strong proposals
- make sure fundamental research remains a core priority!
- invest in creating a proper interface with industry

procuring new systems

Application-Driven Exascale: The JUPITER Benchmark Suite

Managing data in the same way large HEP experiments do (bringing LatticeQCD data management to the XXIst century)

Data Lake prototype for Lattice QCD

RUCIO service provided by DESY-HH

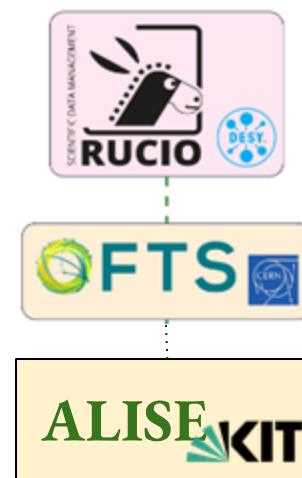

- manage large volumes of data spread across facilities at multiple institutions
- continuously extended to support the LHC experiments and others (SKA)

FTS service provided by CERN

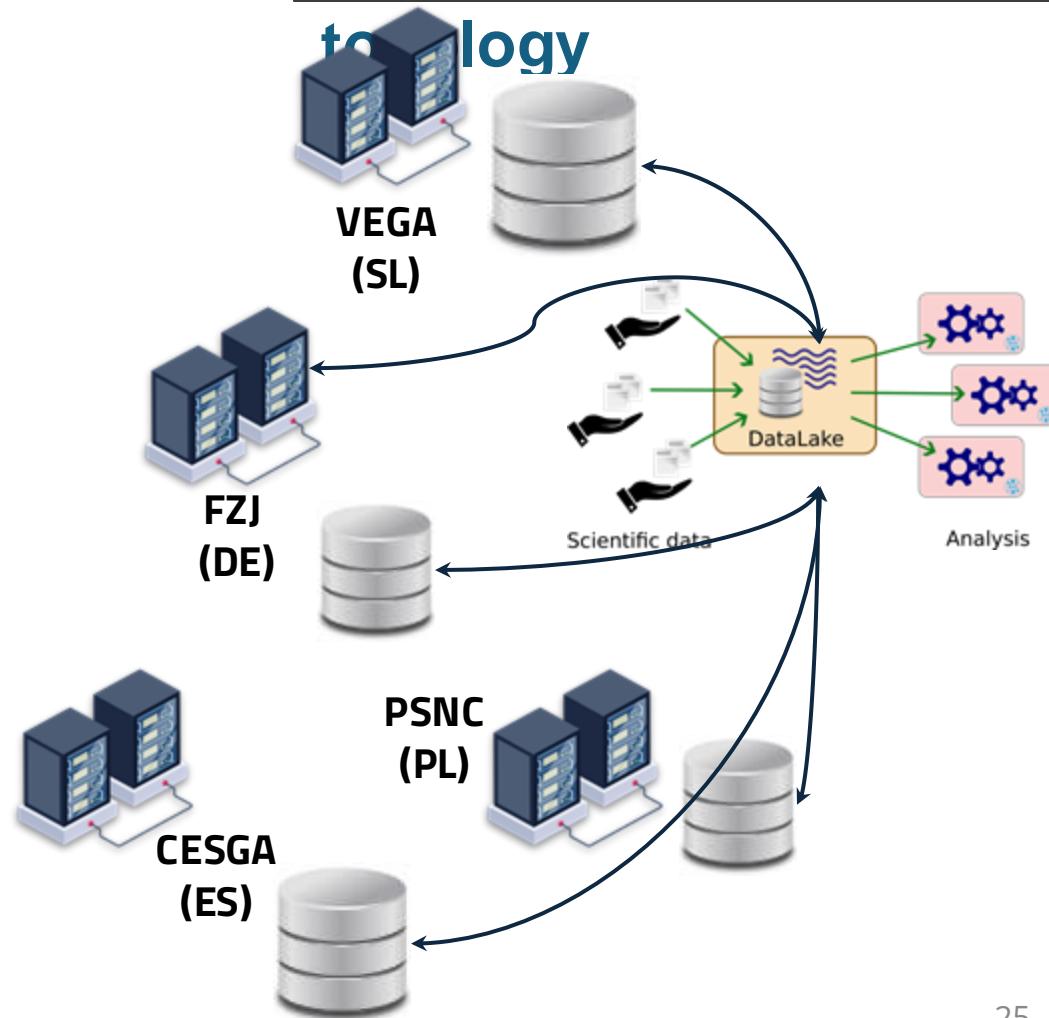

- File Transfer Service used at LHC
- **TODO:** develop an API to use it as experimentals do (commandline cumbersome)

ALISE developed and provided by KIT

- Link local Unix account with any federated identity OIDC compliant
- Expects the local account to exist - these are created following HPC policies
- Towards the dream of having a single account everywhere
- **TODO:** get in touch, and try it
<https://alise.data.kit.edu/>

interTwin Data Lake topology

People!

- Develop efficient algorithms on new architectures
- Requires (in my experience) a lot of domain-specific knowledge – who? where?
- Porting on multiple hardware and benchmarking, data (!)
- Engage in co-design with industry
- Career path for these people!
- Work together with universities
